Winkhaus autoPilot Ergo

For easy and comfortable window operation.

If we have no physical problems we hardly spare a thought on how to operate a window. When in a wheelchair, this everyday action quickly becomes a challenge.

Often windows can only be opened in a standing position or by using some form of aid. Winkhaus offers a comfortable solution that makes it easier for people with limited movement to operate windows by themselves without a third party or other apparatus.

The trend that has been showing in statistics for years is not only becoming true for Germany: The population is getting older. The window of the future will have to go in a direction that takes this fact into account. Our design engineers have therefore developed a fitting that enables the centre-hung sash to be opened from a sitting position.

- Olive-shaped handle at the bottom fitted horizontally to the casement, no visible mechanism
- Easy to operate from a sitting position, turn and tilt to open and close
- Opens and closes only by the lever movement, the slightest operating force required
- Geared action that drives the window in and out
- Suitable for barrier free living
- Ideal for difficult to access windows

Different to conventional windows, the handle is fitted at the bottom of the horizontal casement profile. Turning the handle 180 degrees is sufficient to tilt the window. The integrated geared action takes over the rest and does not require any high degree of force. The windows can of course be opened in the 90 degree position.

The Winkhaus autopilot Ergo helps those who are already thinking about tomorrow.

More and more people will be thinking about such operator friendly elements in their living areas in the future. Include our innovations in your plans. We will be happy to advise you!
